TITLE : SAMPLING APPARATUS OF BLOOD SAMPLE

ABSTRACT : PURPOSE: To obtain a sampling apparatus by which a blood sample can be sampled safely and surely without removing a sealing stopper from a blood sampling tube after a centrifugal separation.

CONSTITUTION: A couple base 10 can be freely raised and lowered, and a coupler 12 is mounted on the coupler base 10. A blood sampling tube 14 is inserted into the coupler 12 in an inverted state, and a sampling needle 26 is pierced through a rubber stopper 24. A packing 38 is used to seal a part between the coupler base 10 and the coupler 12 and to seal a part between a sampling container 16 and the coupler base 10. When they are sealed, they are pressed to the lower part from the upper part with reference to the blood sampling tube 14. The interior of the blood sampling container 16 is sucked and opened to the air repeatedly, and a serum 22 is pulled out without pressurizing the interior of the blood sampling tube 14.
